I have written nine novels since Abduction, and they've all had fairly long birth and death dates. I have other books lined up, however, that need to be finished this year, and I can't wait to share them with readers. One in particular came out of a very unexpected situation. What I learned writing it is that if you're ready to stop your book in the middle of the story, you can make it quite good. After finishing The Legend of Kiran I found myself faced with a lot of questions. I wondered whether I should continue with the book I had started on, or start a brand new one. It didn't feel like I had built a strong enough relationship with Kiran to continue. I wanted to know more about him. I wanted to see him grow and change

KEYMACRO is a multi-scripting scripting language for the DOS platform. Its goal is to provide the user with a simple and easy-to-use language to perform tasks, without the need of programming knowledge. Keymacro doesn't require an installation to run, as you only need to obtain the .skm script. Some ideas can be used to get the best results, as well as a few errors may occur. A lot of methods are included to generate C/C++, COBOL, PHP, ASP, HTML, CSS, JavaScript, VBScript and JScript code. Worthy to mention is that macros support different versions of the operating system, such as Windows 98/ME/2000/XP, DOS 5.0/6.0/7.0/8.0 and Mac OS. The developers made a last update available for Keymacro v6.13, which is fully compatible with Windows 2000. Keymacro Language Specifications: A good piece of trivia about this product is that it's the first scripting language for the DOS platform to support all kinds of windows, offering an easy way to make sure that all of the programs running on the system can be controlled. Keymacro is a great tool to simply automate actions within the system, thanks to its command line interface. As you might notice, its functions are structured in lists, where each one is identified with a corresponding letter. This is to make them much easier to recognize as you add items to the list. The first letter of the list corresponds to the task name, with the other letters being the required data, such as the date, time, the file name and the path of the script. The following table illustrates this approach: Keymacro Scenarios: - Unplug an external keyboard, pointing it toward a remote server - Turn off the internal mouse - Lock the system time on 7:00 p.m. - Disconnect the modem from the router - Unplug the monitor, and finally turn off the PC - Disable the microphone - Erase the internal hard drive - Download the entire contents of your Windows XP system - Uninstall a program that you don't want to be activated again - Delete the system's cookies - Erase the contents of the clipboard - Scrub the system's registry - Delete all the files - Edit the system's hosts file What I do like about the 81e310abbf
