Unfortunately, the large number of competing web browsers makes it difficult to establish one browser as the de facto standard. Thus, every web browser on the market has to support a large set of features, and not all have been supported to the same degree by other browsers. In addition, web designers have been falling over themselves to add new features to browsers to attract new users and retain existing users. Consider the following: A page might load nicely in Internet Explorer, but it shows a blank white box in Firefox, and the scrolling behavior is different. Or, a web developer might point a new browser to a simple web page and the browser will show the web page, but the web page itself doesn't load all of the content. What makes things worse is that web designers often misbehave, and web browsers break websites they didn't even design. The result is that your customers might find the web pages they visit don't display correctly or work on their new computer or mobile device. Or worse, they might find out there's a new version of your web browser, and none of the features work. To enable your customers to view your pages on a wide range of devices, you should make sure that your pages work in all of the most popular browsers.
