From May 23 to July 7, 1977, the Soviet submarine B-24 disappeared in the Pacific Ocean, with all hands presumed lost. In this clip from a documentary produced by the USCGC Morelen (WMS-533) in 1994, USCGC Morelen survivors and relatives of the crew perform a test of ocean surface search systems that will help determine the location of the submarine when it next surfaces. These new results were cross-referenced with the original search area from the original investigation of the case. WMS-533/USCGC Morelen will return to the search for B-24. For the year, the USCGC Morelen assisted in 45 high-resolution searches. Fourteen of these were conducted off the coast of Hawaii, while the remainder were conducted in Mexican waters and the Norwegian Sea. In October 1982, the B-24 is presumed to have surfaced in the Pacific Ocean near the location of the US Navy's Plane Carrier Anti-Submarine Warfare (PCASW) exercises, near the Midway Atoll. Airplane track along with satellite imagery pointed to an underwater object. On Oct. 3, 1982, the B-24 was located at a depth of 3,603 meters (11,775 feet) using its acoustic transmitter and direction finder. This vessel was an electric-powered undersea craft, with considerable range. USCG Morelen special operations forces were able to successfully penetrate the hull, which revealed the rear of the vessel. The submarine was externally frozen, but salvage was not considered a viable option. It is presumed that the submarine had met its end after B-24's electric motor stopped working, and it surfaced at night. The Needham-class cutter USSUSCGC Oceanographer (WAG-274) was joined by the Caperton-class cutter USSUSCGC Waesche (WAG-250) to make another search for B-24 in January-February 2013. The B-24 is a 166-foot (50-meter) all-electric attack submarine operated by the Russian Navy. It was built in the USSR and completed in 1973. This is an audio-visual record of the Original Investigation of the B-24/USUSCGC

Structural studies on lipooligosaccharides from *Nocardia transvalensis*. Lipooligosaccharides (LOSs) derived from *Nocardia transvalensis*, a well-known opportunistic human pathogen, have been investigated. The LOSs were separated and purified by gel chromatography on Bio-Gel P-4 column. Fractions containing LOSs were re-chromatographed on silica gel and mica. The structures of O-antigen chains were studied by partial acid hydrolysis, methylation analysis, and 1D and 2D nuclear magnetic resonance spectroscopy. It is shown that the LOS core is composed of a heptose, a 2,3-dideoxy-2,3-didehydro-d-glycero-D-galacto-octyl (Fuc2S04) disaccharide (7) and the following oligosaccharide unit: 2-acetamido-2-deoxy-d-mannooct-4-ulosonic acid (6) [2-acetamido-2-deoxy-l-glycero-l-talo-oct-4-ulosonic acid (4) (Kdo)2]2-acetamido-3,6
