RAMDisk has a particular method of storage.

Unlike any other physical drive, a virtual drive will store data from the system RAM, the value

allocated upon creating the disk. One positive aspect of this storage environment is related to the security of information. How so? Well, data stored on a physical drive will stay there even after the machine was shut down, to make it easily retrievable once the power has been restored. In this case, a drive created with RAMDisk will completely wipe all data when the power is off, assuring no one else will get to it. On the other side of the fence is speed. RAMdisk can prove its usefulness in speeding up processes like games, browsers, audio/video editing programs, CAD apps, software compilers, database managers, SETI operations, and more. Another positive aspect would be the noise. An HDD becomes somehow noisy when it's running at full bandwidth, but this problem is nonexistent with RAMdisk. All in all, if you wish to experiment with creating virtual drives and testing their capabilities Dataram RAMDisk Free Download is the right tool for the job. ### What's New in the Dataram RAMDisk?

RAMDisk is a program for creating a virtual drive with data that resides only in the computer memory. RAMDisk is the most compact way to create a virtual drive and put it together by just selecting a suitable size and initial format. Creating a RAMDisk is pretty easy, but it requires to know the following things: What is the minimum capacity you wish to have, the limit that RAMDisk will never exceed. What initial format you wish to use. Creating a RAMDisk To create a RAMDisk, start by selecting the RAMDisk as a new volume. For the default settings, you can check "Standard" to allocate the entire available RAM, and format it to match the default format. In this case, a typical RAMDisk will be the Standard OST (Open Source Tapes) format and be located in the C: drive. As for size, you need to know how much RAM you have. One of the features of RAMDisk is related to storage size only. It doesn't matter whether you are using a Desktop PC or a Laptop, or a Tablet, it will always be the same size as the RAM you are running on. In this example, I'm running on a machine with 16GB of RAM, and the RAMDisk will be exactly 16GB. For the default settings, all is good. Once you have created your RAMDisk, you can close the wizard, and try to create a file on it. In this case, I'm trying to create a new file called "C:\007.txt". This experiment will erase everything on the RAMDisk. The RAMDisk isn't there, but the file is. Now, if you look at your Computer, C:\007.txt should be there. The file has been created, but it also contains the C:\007.nib (not the real file) that is a kind of anchor to the file on your RAMDisk. If you double-click on it, the file will open. If you use it, it will be embedded to the RAMDisk and lost only when the RAMDisk is closed or erased. That's not all. To make the file available on the RAMDisk you also need to copy it. You can do that by opening the Show hidden files and folders, and browse the C:\007.txt location. Sometimes you might also want to know the size of the RAMDisk, or the size of
